

Koue Bokkeveld Opleidingsentrum CLT Kamp 21-22 March 2009

HIKING ABOVE SANDDRIFT:

Quinton showing the group some of the finer points of tracking

The route took us right through the rocks

At the site where a leopard once ate a Klipspringer

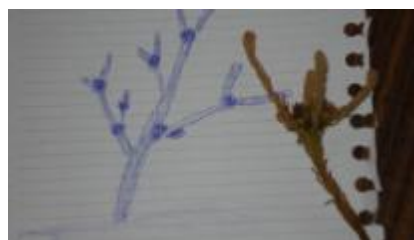

Quinton caught a Rock agama lizard. Touching it was a delight to some and utterly terrifying to others. The photo, right, shows a moment of courage. It is a common misconception that lizards are poisonous.

'How important is it to protect this wilderness?' - 'This important!'

OBSERVATION THROUGH ART:

All participated with deep concentration in a plant drawing observation exercise

TRACKING:

We picked up a strong signal from 'Spot', so we decided to take a download and then force a fix, giving us her location at that moment. To our utter surprise, she was only 315m away, in the valley.

It was unbelievable; soon we were right there, less than 30m from her. She was under that tree, but we couldn't see her.

Somehow she sneaked off down the river bed without anyone noticing. We followed her tracks, but she was gone
